

Thank you!

By installing this habitat structure, you are providing an essential nesting area for wildlife in need. Landowners like you play a vital role in providing habitat for wildlife in the Credit River watershed.

Habitat

Great crested flycatchers are found in deciduous or mixed woodlands and breed in forest edges, secondary-growth forests, hedgerows and isolated woody patches. They perch on dead branches with good views near the top of the tree canopy. They scour the area for insects to swoop down and grab.

When to Expect Them

Early May to late July

Call

Sounds like: A loud, piercing “Weee-eeep”

Habitat Structure Placement

| | |
|------------------------------|--|
| Location | Open woodland, forest edge, park, backyard |
| Height off Ground (m) | 1 to 7 |
| Entrance Hole Facing | Any direction with an open flight path |
| Spacing | 1 box every 2.4 ha |
| Attach to | Hang box from live or dead tree |
| Installation Time | September to April |

Care of the Habitat Structure

Clean out old nest material before the breeding season begins in May. To access the box, turn the latch near the bottom of the box and rotate the moveable panel upward.

Important Notes

European starlings are able to fit inside a flycatcher house. To deter them from nesting, hang the box from a live or dead tree rather than mounting it on a pole.

What Else Can You Do to Help?

Take action to provide natural nesting sites for flycatchers on your property, reducing the need for nest boxes. Leave dead standing trees that do not pose a hazard to people to provide shelter and breeding space.
